

ABSTRACT OF THE DISCLOSURE

The spill-proof coloring container is an invention that because of its unique geometry and design, will when oriented in any position prevent spillage of liquid contents when filled to predetermined amount. Because of the use of vacuum formed sheet in the construction of the container, the container pieces are compactly stackable and are of substantially low manufacturing cost. The container is principally intended for use by young children to facilitate painting pictures and dying objects such as Easter eggs without the mess otherwise associated with painting and dying. The invention is also intended to help avoid the mess associated with pouring paint or paint powder concentrates otherwise encountered when preparing a cup of paint for general purpose painting.
